

## Worksheet: Inference on a population mean

**1-sample t-test**

1. State hypotheses:  $H_o : \mu = \mu_0$  vs one of three alternatives:  $H_a : \mu > \mu_0$  or  $H_a : \mu < \mu_0$  or  $H_a : \mu \neq \mu_0$ .
2. Calculate test statistic from data:  $t = \frac{\bar{x} - \mu_0}{s/\sqrt{n}}$ .
3. Knowing the test statistic lives in a  $t$ -dist'n with  $n - 1$  df, determine the P-value.
4. State conclusion in the context of the problem in relation to a chosen significance level.

1. **Do Linfield students sleep less than 8 hours a night, on average?** To help answer this question we can devise a test of significance. Let  $\mu$  = the true mean hours of sleep per night among Linfield students.

(a) State the null and alternative hypotheses for your test.

(b) Now suppose you collect the following data: A SRS of size 100 Linfield students yields a sample mean of 7.8 hours of sleep a night, with a sample standard deviation of  $s = 0.8$  hours. Determine the test statistic for these data.

(c) Compute the P-value for these data. Are these data statistically significant at the  $\alpha = .05$  level?

2. **Nicotine in cigarettes.** To determine whether the mean nicotine content of a brand of cigarettes is different than the advertised value of 1.4 milligrams, a health advocacy group tests  $H_o : \mu = 1.4$  vs  $H_a : \mu \neq 1.4$ . The calculated value of the test statistic from a sample of size  $n = 100$  is  $t = 2.42$ .

(a) Below is a sketch of the  $t_{99}$  distribution. Shade the area that corresponds to the P-value for this test.

- (b) Determine the P-value for this test, and conclude whether these data are statistically significant at the 5% level.

3. **Are aliens just interested in meeting smart people?** The IQ of adults in the US varies normally with mean  $\mu = 100$ . In a 1993 study, researchers took a sample of 25 people who claimed to have had an intense experience with an unidentified flying object (UFO). The sample mean IQ of this group was  $\bar{x} = 107.6$ , with sample standard deviation  $s = 8.9$ .

Conduct a test of significance at significance level  $\alpha = .05$  for assessing whether the sample data support the belief that the mean IQ among all people who have had intense UFO experiences exceeds 100. [That is, are the aliens just interested in the smart people?]. State hypotheses, calculate the test statistic, determine the p-value, and state your conclusion in the context of this problem.
